

quantum analogues from phase pdf

In physics, Liouville's theorem, named after the French mathematician Joseph Liouville, is a key theorem in classical statistical and Hamiltonian mechanics. It asserts that the phase-space distribution function is constant along the trajectories of the system—that is that the density of system points in the vicinity of a given system point traveling through phase-space is constant with time.

Liouville's theorem (Hamiltonian) - Wikipedia

A wave function in quantum physics is a mathematical description of the quantum state of an isolated quantum system. The wave function is a complex-valued probability amplitude, and the probabilities for the possible results of measurements made on the system can be derived from it. The most common symbols for a wave function are the Greek letters ψ or Ψ (lower-case and capital psi, respectively).

Wave function - Wikipedia

These operators will operate on a wave function, Ψ , which is assumed to exist, and which is assumed to contain all that is knowable about the quantum mechanical system. We would then solve the resulting equation to get the particulars. And so, in this example, we can write the substitutions into the classical expression for total energy.

A design-to-device study, based on algorithmic encodings of structure-property relationships, is used to identify new materials with panchromatic optical absorption. 9431 dyes are mined from the literature and optimally paired together to afford co-sensitizing dyes with complementary optical absorption properties. Promising combinations are experimentally verified in dye-sensitized ...

A new chemical process is developed to prepare strongly ferromagnetic SmCo₅ nanoparticles (NPs) via controlled reduction of SmCo₅O₇ multipods. The 200 nm SmCo₅ NPs embedded in polyethylene glycol are aligned magnetically and show the room temperature coercivity of 49.2 kOe. The synthetic method has also been extended to prepare ferromagnetic Sm₂Co₁₇ and Sm₂Fe₁₇N₃ NPs.

Fig 2 . Schematic representation of PET principle. (A) After travelling in tissue (positron range) positron loses energy and annihilates with electron resulting in two 511 keV annihilation photons travelling in opposite directions; (B) Annihilation photons are registered externally by radiodetectors consisting of scintillation crystals and photomultiplier tubes and assembled in a ring.
